1. Respondent Information

1.1 Axestrack Overview

Since its inception in 2008, Axestrack has been at the forefront of transforming the logistics and transportation industry through innovative digital solutions. What began as a small-scale operation in Jaipur has evolved into a leading player in India's logistics landscape.

Our growth story is a testament to the power of entrepreneurship. A team of like-minded individuals united to create a company that would redefine the way logistics is done. Today, Axestrack is proud to serve over 250,000+ commercial vehicles across 100+ cities, offering a comprehensive range of digital solutions. (For more about the platform please visit - <https://www.axestrack.com/>)

Our flagship product, the Axestrack Operating System (commonly known as aOS), leverages cutting-edge AI technology to optimize supply chain operations. By providing real-time data, analytics, and insights, we empower businesses to make informed decisions, improve efficiency, and reduce cost.

Beyond telematics, we offer a comprehensive suite of digital solutions tailored to meet the unique needs of our clients. From seamless integration with ERP systems to advanced analytics and AI-driven insights, we empower businesses to build a robust digital thread that drives efficiency and growth. By digitizing information and processes, we help our clients stay ahead of the curve and achieve their long-term goals.

At Axestrack, we believe in partnering with our clients to achieve their strategic objectives. By understanding their unique needs, we tailor our solutions to deliver maximum value. Our commitment to innovation, quality, and customer satisfaction has made us a trusted partner for businesses across India.

Further, we have accomplished ourselves as true partners to some of the marquee clients in the industry. Key mentions are: -

1.2 Axestrack Expertise & Recognitions

1.2.1 Going beyond real-time visibility (unified platform for logistics)

Axestrack with its suite of products (xSwift, Connected Plant Logistics, Managed Control Tower, Connected Port Logistics, etc.) provides state-of-the-art tracking and visibility to shippers and fleet owners.

The unified, single-pane view across all platforms facilitates rapid and informed decision-making. This connected operating system is structured into three key layers: **See, Understand & Learn, and Act**.

- The **See** layer aggregates data from multiple sources, including third-party GPS/Telematics systems, 3PL providers, ERP/TMS platforms, toll systems, government portals, OEM systems, third-party SIMs, and open APIs. This data is consolidated into a comprehensive data pool via a robust integration layer.
- The **Understand & Learn** layer leverages advanced AI and machine learning capabilities to transform this data lake into a data pool, enabling deeper insights and meaningful analytics.
- The **Act** layer presents this processed data through unified platforms, offering actionable analytics and reports. These insights empower the Managed Control Tower to make real-time interventions, ensuring efficient operations and improved outcomes.

1.2.2 Recognized by analysts

Axestrack has been widely recognized as a top digital solution provider through industry research, awards, and strategic partnerships. Axestrack has received numerous awards and accolades for its innovative digital solutions, including Gartner's 2024 Market Guide for Fleet Telematics.

Axestrack believes in excellence which led our innovations and product capabilities recognized by multiple analysts and market leaders to solve transportation challenges in the industry.

According to Gartner 'The fleet telematics market is growing, driven by the increasing demand for efficient fleet management solutions and operational optimization. This growth is catalyzed by widespread telematics adoption, supportive regulatory frameworks, reduced operational costs and enhanced customer satisfaction through real-time visibility on deliveries, driver safety and retention. The integration of AI, ML, and big data analytics is poised to propel the market forward by delivering advanced insights and predictive capabilities for fleet management.'

1.2.3 Stability with scale

At Axestrack, we are more than a solution provider—we are strategic partner. With over 15 years of experience in logistics and technology, and the management of our own fleet of 200+ vehicles, we leverage our deep industry expertise to proactively analyze key business KPIs and recommend targeted solutions that address operational gaps. As a bootstrapped and profitable organization, we currently manage 2.5 lakh+ fleets and oversee lakhs of trips monthly.

Our in-house Center of Excellence (CoE) designs, develops, and deploys cutting-edge digital solutions tailored to the logistics industry. These solutions support every stage from proof of concept (POC) to full implementation and enhancement. Our unified platform (**Connected Plant Logistics**) seamlessly integrates with any ERP system as a bolt-on solution, enabling faster, more efficient plant operations and driving impactful improvements across internal plant logistics processes.

2 Proposed Solution

2.1 Our Understanding of Apcotex's Business Process

The Apcotex's outbound dispatch process is predominantly manual and lacks system integration, resulting in operational delays and limited transparency. After the dispatch plan is finalized, transporters receive intimation through email and arrange vehicles accordingly. On arrival at the plant, security personnel carry out document verification manually before granting entry. Vehicles then move to the weighbridge and loading areas where weighment, loading instructions, and related data are recorded on paper, with no connection to the SAP system. Invoicing is also performed manually, adding to processing time and increasing the risk of errors or discrepancies.

Once vehicles enter the plant, there is no digital visibility of their location or status at various stages such as waiting, loading, or post-loading checks. This makes it difficult to identify bottlenecks, track turnaround time (TAT), or monitor loading productivity. After dispatch, the absence of a unified tracking mechanism and the fragmented transporter network further result in no real-time visibility of vehicles while in transit. Similarly, for inbound movements, there is no real-time visibility of trucks carrying critical raw materials, leading to poor planning, delays in material availability, and hampered operational efficiency. Additionally, the manual checks at the gate are time-consuming, further slowing down the overall supply chain.

Key Challenges

- Entirely manual gate security checks, weighbridge operations, and loading processes with no SAP integration
- No digital visibility of vehicle movement or stage-wise status inside the plant, leading to hidden bottlenecks
- Inability to monitor TAT, loading efficiency, or productivity in real time
- Manual invoicing that prolongs processing and increases the risk of errors
- Lack of real-time vehicle tracking on outbound routes due to a fragmented transporter network
- No real-time visibility of inbound truck movement for critical raw materials, causing poor planning and operational inefficiencies
- Lengthy and manual gate verification process that delays both inbound and outbound movements

2.1.1 To-be Process

The proposed **"Unified Digital Logistics Solution"** replaces manual tasks with automated, real-time workflows for both outbound, inbound and in plant movements. Dispatch planning is executed on a centralized platform linked to SAP, where transporters receive dispatch schedules and upload vehicle and driver details before arrival. Pre-arrival validation checks the documents—such as driver license, vehicle fitness certificate, and insurance—against predefined rules, enabling automatic approval or flagging exceptions. Once validated, the system generates a digital gate pass and sends an entry slot confirmation to both transporter and plant security.

At the plant gate, vehicles are authenticated through RFID and Automatic Number Plate Recognition (ANPR), drastically reducing entry time and eliminating paper-based verification. Inside the plant, IoT

sensors installed strategically at various stages provide live visibility of vehicle movement across all stages—waiting, loading, and weighbridge operations. Weighbridge data flows directly to SAP, triggering automated loading confirmation and digital invoicing.

For inbound logistics, the same platform tracks raw-material trucks from source to plant and share accurate ETAs. Pre-arrival validation ensures all driver and vehicle documents are approved before gate entry, preventing delays and supporting better production planning. Real-time dashboards give operations and management teams complete oversight of TAT, bottlenecks, fleet utilization, and transporter performance, driving proactive decisions and continuous efficiency gains.

Key Benefits

- **Pre-Arrival Validation:** Automated verification of driver and vehicle documents ensures compliance and speeds up gate entry.
- **End-to-End Visibility:** Live tracking of inbound and outbound vehicles, both in transit and inside the plant.
- **SAP Integration:** Automated weighbridge data capture and digital invoicing reduce manual errors.
- **Faster Gate Operations:** Digital gate passes and RFID/ANPR authentication minimize waiting time.
- **Optimized TAT & Planning:** Accurate ETAs and real-time stage monitoring improve scheduling, inventory control, and overall productivity.

3 Process Flow for the Outbound Movement:

3.1 Stagewise Action points:

Stage	Scope	Benefits	Implementation Phase
Vehicle Alignment and Pre-validation	- Integration with SAP for DO details - Notification to transporters - Vehicle Alignment by transporters - Vehicle & driver pre-validation through ULIP integration - Exception Handling	- Migration from manual to automatic process - Seamless vehicle alignment and validation process - No manual errors	Phase I
Parking In	- Parking Access Control - Auto/manual parking allocation - TAT Measurement - Parking capacity management	- No unauthorized entry - Seamless vehicle validation - Real time parking visibility - Authorized Exit access	

Parking	• Auto announcement & IVR calls for drivers • Checklist • Queue management	• No congestion inside the plant • TAT monitoring	
Parking Out	• Authorized exit access • Turnaround time		
Gate IN	• Vehicle validation and Access • Customized checklists • GPS validation • Evidence Collection	• Quick Turnaround time • Elimination of manual check	Phase I
Tare Weight	• Man less fully automated weighbridge • Evidence capturing • Weight tolerance management • Integration with SAP for invoice creation	• Quick Turnaround time • Elimination of manual intervention • Seamless data flow to the SAP	Phase II
Loading Bay	• Dock management System • Digital loading slip • Customized checklist • TAT measurement • Productivity Management	• Seamless Loading process • Quick Turnaround time • Elimination of paper-based loading checklists • Elimination of manual errors	
Gross Weight	• Man less fully automated weighbridge • Evidence capturing • Weight tolerance management • Integration with SAP for invoice creation	• Elimination of manual process • Auto invoicing • Seamless data flow to the SAP	

Gate Out	• Vehicle final check • TAT measurement • Invoice Check • Customized checklist	• Quick Turnaround time • Audit trails	Phase I
Enroute Visibility	• Real time Visibility • Unauthorized halt alerts • Route Deviations alerts • GPS Malfunction alerts • TAT Measurement	• Proactive non-compliance management • Optimized TAT • Driver/ transporter profiling	Phase I

4 Process Flow for the Inbound Movement:

4.1 Stagewise Action points:

Stagewise	Scope	Benefits	Implementation Phase
Vehicle Alignment and Pre-validation	- Integration with SAP for PO details - Notification to transporters - Vehicle Alignment by transporters - Vehicle & driver pre-validation through ULIP - Exception Handling	- Migration from manual to automatic process - Seamless vehicle alignment and validation process - No manual errors	Phase I

Enroute Visibility	- Real time Visibility - Unauthorized halt alerts - Route Deviations alerts - GPS Malfunction alerts - TAT Measurement	- Visibility on ETA - Inventory Optimization - Proactive non-compliance management - Optimized TAT - Driver/ transporter profiling	Phase I
Parking In	- Parking Access Control - Auto/manual parking allocation - TAT Measurement - Parking capacity management	- No unauthorized entry - Seamless vehicle validation - Real time parking visibility - Authorized Exit access - No congestion inside the plant - TAT monitoring	Phase I
Parking	- Auto announcement & IVR calls for drivers - Checklist - Queue management		Phase I
Parking Out	- Authorized exit access - Turnaround time		Phase I
Gate IN	- Vehicle validation and Access - Customized checklists - GPS validation - Evidence Collection	- Quick Turnaround time - Elimination of manual check	Phase I
Gross Weight	- Man less fully automated weighbridge - Evidence capturing - Weight tolerance management - Integration with SAP for invoice creation	- Quick Turnaround time - Elimination of manual intervention - Seamless data flow to the SAP	Phase II
Unloading Bay	- Dock management System - Digital loading slip	Seamless Unloading process	

	- Customized checklist - TAT measurement - Productivity Management	- Quick Turnaround time - Elimination of paper-based loading checklists - Elimination of manual errors	
Tare Weight	- Man less fully automated weighbridge - Evidence capturing - Weight tolerance management - Integration with SAP for invoice creation	- Elimination of manual process - Auto invoicing - Seamless data flow to the SAP for GRN creation	
Gate Out	- Vehicle final check - TAT measurement - Invoice Check - Customized checklist	- Quick Turnaround time - Audit trails	Phase I

4.2 Technical Scope

- Seamless Integration with ERP & Weighbridge through API
 - Establish a real-time interface for bidirectional data exchange
 - Pull required fields from ERP to the application for validation and trip creation.
- Integration with Ulip for vehicle and driver document verification

4.3 Out of Scope

- ERP Third Party products performance optimization
- Data cleansing and data extraction from source system
- Issues and bugs related to 3rd Party product or services or plugins
- Customization related to 3rd party products
- Coordination with Third Party Agent

7 Pragmatic View of Product Roadmap & Innovations Planned

Axestrack's product roadmap has been built keeping current and future needs of the industry in scope. The roadmap establishes our commitment to the innovations and capabilities which we co-develop with client to ensure these developments are relevant to the needs of the clients.

The intent behind this vision is simple. We understand that “connectivity” is the way for future and hence the core of any solution must embrace the connected part and should support the mechanisms which promotes connectivity.

We understand that while vision is clear, we also need to keep the structural elements flexible and modular. Hence, the design of our architecture and roadmap has been envisioned to be ‘modular and agile’.
